

# Clinic Copilot BD

## Vibe to Production in 180 Seconds

Recording script, click cues, and timing guide

**Best opening line:** Small clinics do not need another chatbot. They need a safer way to move from messy intake to reviewed care workflow.

## Recording Setup

- Record screen at 1080p. Keep browser zoom around 90-100%.
- Open the live demo: <https://bracu-steel.vercel.app/>
- Keep these URLs ready: /login, /docs, /api/mcp, and /pitch.
- Use the seeded demo account if needed: doctor@demo.clinic / demo1234.
- Target length: 180 seconds. Speak clearly and keep clicks moving.

## 180-Second Timeline

| Time      | Segment  | Screen action                            | Key message                                                            |
|-----------|----------|------------------------------------------|------------------------------------------------------------------------|
| 0:00-0:30 | Problem  | Homepage hero, slow scroll               | Messy intake and weak handoffs create safety and time pressure.        |
| 0:30-1:00 | Solution | Login, Overview screen                   | Bangla-first AI clinic workspace, not a diagnosis engine.              |
| 1:00-1:20 | Start    | Click Start guided workflow, Open Intake | First screen makes the workflow obvious.                               |
| 1:20-1:40 | Intake   | Load Dengue watch or Child hydration     | AI cleans mixed Bangla-English intake into structured review material. |
| 1:40-2:00 | Review   | Sidebar: Review                          | Safety, red flags, missing questions, approval readiness.              |
| 2:00-2:15 | Patient  | Sidebar: Patient                         | Handouts, teach-back, family clarity.                                  |
| 2:15-2:30 | Ops      | Sidebar: Ops                             | Queue pressure, follow-up, trends, audit.                              |
| 2:30-2:45 | AI + MCP | /docs then /api/mcp                      | Gemini, Convex, AI SDK, MCP endpoint.                                  |
| 2:45-3:00 | Impact   | Return to homepage or pitch page         | Faster docs, clearer communication, safer follow-up.                   |

## 0:00-0:30 — Problem

### Mouse / Screen

- Start on homepage hero.
- Slowly scroll so hero, login card, and MCP badge are visible.

### Say word by word

Small clinics in Bangladesh do not need another generic chatbot. They need a safer way to move from messy intake to reviewed clinic workflow.

In many clinics, reception notes are rushed, mixed Bangla-English, incomplete, and often not connected to follow-up. Doctors and health workers lose time rewriting notes, checking red flags, explaining care to families, and making sure someone owns the next step.

That creates delays, unclear handoffs, and safety risks.

## 0:30-1:00 — Solution

### Mouse / Screen

- Click Start demo or Launch clinic demo.
- Sign in or create demo session.
- Land on app Overview.

### Say word by word

Clinic Copilot BD is a Bangla-first AI clinic workspace.

It turns messy reception notes into structured drafts, missing questions, red-flag review, patient handouts, teach-back prompts, follow-up actions, and operations visibility.

This is not a diagnosis engine. AI drafts, staff verify, and clinicians decide. The product is built as a clinic workflow cockpit, not just an isolated AI textbox.

## 1:00-1:20 — Overview / Guided Start

### Mouse / Screen

- Point to Start guided workflow.
- Click Start guided workflow.
- Click Open Intake.

### Say word by word

After login, the first screen gives the clinic team an obvious starting point. Staff can run a guided workflow, jump to intake, open clinical review, or go straight to operations.

This matters because real clinic users do not want to hunt through a demo. The workflow has to be obvious under pressure.

**Pacing note:** If you are behind time, compress the next section and move to the next sidebar page.

## 1:20-1:40 — Intake

### Mouse / Screen

- Choose Dengue watch or Child hydration.
- Show messy Bangla-English intake text.
- Click generate, cleanup, or draft if visible.

### Say word by word

Here, reception can type, paste, or speak intake notes in Bangla, English, or mixed language.

The AI cleans the intake and extracts the useful workflow details: patient story, symptoms, missing questions, possible red flags, medicine uncertainty, and what the clinician needs to review.

## 1:40-2:00 — Clinical Review

### Mouse / Screen

- Click sidebar Review.
- Show risk explanation, doctor console, approval readiness, handoff, and closeout areas.

### Say word by word

The review page keeps safety visible. It shows red flags, missing information, risk explanations, staff handoff, doctor notes, approval readiness, and visit closeout.

The important design choice is that AI does not approve care. It prepares review material so the clinician can decide faster and more clearly.

## 2:00-2:15 — Patient Communication

### Mouse / Screen

- Click sidebar Patient.
- Show handout, teach-back, patient question, or reply tools.

### Say word by word

The patient page turns clinical notes into plain patient communication.

The clinic can create Bangla-English handouts, urgent return warnings, follow-up messages, and teach-back prompts so families can repeat what they understood before leaving.

**Pacing note:** If you are behind time, compress the next section and move to the next sidebar page.

## 2:15-2:30 — Operations

### Mouse / Screen

- Click sidebar Ops.
- Show Operations Pulse, trend dashboard, audit log, and follow-up panel.

### Say word by word

The operations page shows the whole clinic day, not one isolated chat.

The team can see queue pressure, follow-up ownership, trends, readiness, audit history, and which cases need attention next.

## 2:30-2:45 — AI + MCP Approach

### Mouse / Screen

- Switch to /docs.
- Scroll to MCP section.
- Show /api/mcp briefly.

### Say word by word

Technically, the app uses Next.js, Convex, the Vercel AI SDK, and Google Gemini.

We also built a custom MCP-compatible endpoint at slash api slash mcp. It exposes demo-safe tools and resources: synthetic clinic scenarios, workflow capabilities, and an AI workflow brief tool.

That means external agents can understand the clinic workflow without accessing real patient records.

## 2:45-3:00 — Impact / Close

### Mouse / Screen

- Return to homepage or pitch page.
- End on hero, logo, or product screenshots.

### Say word by word

Our expected impact is faster documentation, clearer patient instructions, safer review, and better follow-up ownership for small clinics.

Next, we want production authentication, OCR for prescriptions and lab reports, WhatsApp follow-up, and clinic pilots with anonymized data.

Clinic Copilot BD is built for Bangladesh first, but this workflow problem is global. This is our proof that we can move from vibe to production.

## Fast Recording Checklist

- Homepage hero shown in first 10 seconds.
- Overview Start guided workflow button shown clearly.
- At least one real sidebar page switch shown.
- One AI-generated or AI-ready workflow surface shown.
- Patient communication or teach-back shown.
- Operations dashboard shown.
- /docs page shown for AI and MCP proof.
- /api/mcp endpoint shown briefly.
- End with impact and next steps.

**If you need to cut time:** Skip the Patient section and say: After review, the same case can generate patient handouts, teach-back prompts, follow-up messages, and operations updates.
